In Re: GN Docket No. 25-133

I’d like to call upon an edit to Title 47, Chapter 1, Subchapter D, Part 95, Subpart E. While I understand there are rules that define GMRS radios, GMRS is a select group of frequencies allocated for the purpose. But, imagine real life scenarios and why these rules are very restrictive. I have both a GMRS and Ham license. As a GMRS licensee, my family is able to use GMRS. But, based on your rules I would have to carry both a GMRS radio and a Ham radio if I wanted to communicate with my family and then other Ham Radio licensees. Why? Why do I need multiple devices? As a dual licensee operating on equipment that technically can receive and transmit on GMRS frequencies, why not allow for that? I can see the logic of restricting a GMRS device from transmitting on non-GRMS frequencies but not the inverse if licensed accordingly.

Thanks,

Michael Sargent
